

MinimusMaximus

A little effort goes a long way.

1. Meet MinimusMaximus

ONE PAGE, ONE MACRO, PLENTY OF PERSONALITY

1 Character: choose the overall attitude.

2 Focus: decide what part of the signal matters.

3 Effort: the main macro - turn this first.

4 Analyze / Output: see what the plugin is doing.

5 Random + FLIP: surprise or invert the current idea.

6 Creative FX: Rev Grain, Glitch and Micro Loop.

7 Motion / Space / Glue / Width / Output.

Quick rule: start with Character + Focus, turn Effort until the source changes enough, then use the five lower knobs to shape the result. Bring in the creative FX last.

2. Your first five minutes

A FAST ROUTE TO A USEFUL SOUND

- 1 Choose a Character** Warm is an easy starting point; Alive and Strange are more animated.
- 2 Choose a Focus** Body for weight, Air for shine, Transient for attack, Full for the whole signal.
- 3 Turn Effort** Move slowly from 25% to 65%. Stop when the transformation is obvious but still musical.
- 4 Shape the result** Use Motion, Space, Glue and Width. Keep Output for level matching.

Tip: the plugin is designed to reward movement. A preset is a starting point, not a destination - try changing only one control at a time and listen for the point where the source becomes more interesting without losing its identity.

3. Character + Focus

THE TWO FASTEST DECISIONS

CHARACTER

Warm	rounder, softer, richer
Wide	spacious stereo emphasis
Deep	weight and depth
Alive	movement and animation
Dusty	lo-fi sampler / worn digital colour
Strange	less predictable, more transformed

FOCUS

Transient	attack, edges, articulation
Body	mid-range weight and presence
Air	upper detail and openness
Full	broadest, most complete treatment

Selected Character and Focus buttons glow yellow. If a source feels too processed, lower Effort before changing the Character - the macro is deliberately the main intensity control.

4. The five finishing controls

SHAPE THE RESULT AFTER EFFORT

MOTION

Adds movement and modulation. Low values keep things steady; higher values make the sound evolve.

SPACE

Opens the sound into a larger environment. Useful after dense Character settings.

GLUE

Pulls the result together and smooths the processing into the source.

WIDTH

Controls stereo spread. Check mono if you push it hard.

OUTPUT

Final level trim. Match perceived loudness when comparing settings.

A useful habit

Adjust Output last. Matching level before bypassing is important: louder nearly always sounds more impressive, so level-matching gives you a fairer judgement of what the processing is actually adding.

5. Creative FX

THREE SWITCHES, THREE DIFFERENT KINDS OF DISRUPTION

REV GRAIN

Reverse fragments with overlapping envelopes. Best for ghosted tails, swells and reversed texture.

START HERE

Try 30-55% for musical texture; use the top end for more obvious clouds.

Yellow power glow = effect active

GLITCH

Rhythmic edits and rearrangements with longer clean gaps between events.

START HERE

40-65% is the sweet spot; above that becomes deliberately more disruptive.

Yellow power glow = effect active

MICRO LOOP

Tempo-aware looping with harmonic-safe rate choices and an airy grain-cloud tail.

START HERE

Let it hold a phrase for several cycles. Around 45-70% gives flowing rhythmic clouds.

Yellow power glow = effect active

6. Random, FLIP and the displays

EXPLORE WITHOUT LOSING YOUR BEARINGS

RANDOM

Creates a musically sensible variation. Use it when you want a fresh direction rather than a tiny edit.

FLIP

Press once to morph toward the musical opposite of the current state. Press again to return to the exact original state.

ANALYZE

A coloured spectral view. Use it to see where processing is concentrating energy and whether high-frequency content is building up.

OUTPUT

Stereo waveform plus L/R LED meters. Green is healthy level; the top red segments indicate hotter peaks.

7. Sound recipes

STARTING POINTS - ADJUST BY EAR

Warm Bloom Pad

PADS / CHORDS

Character	Warm
Focus	Body
Effort	45%
Motion	25%
Space	55%
Glue	60%
Width	120%
Rev Grain	35%

Softens the front edge, adds space and lets reverse grains bloom around sustained notes.

Dusty VHS Keys

KEYS / SAMPLES

Character	Dusty
Focus	Full
Effort	55%
Motion	15%
Space	20%
Glue	45%
Width	105%
Micro Loop	OFF

Leans into the worn-digital character without turning the hiss into the main event.

Alive Percussion

DRUMS / PERCUSSION

Character	Alive
Focus	Transient
Effort	50%
Motion	65%
Space	15%
Glue	35%
Width	115%
Glitch	40%

Keeps the attack forward while adding motion and occasional rhythmic edits.

Wide Ghost Guitar

GUITAR / PLUCKS

Character	Wide
Focus	Air
Effort	58%
Motion	30%
Space	48%
Glue	28%
Width	150%
Rev Grain	45%

A bright, spacious treatment with reversed details that sit behind the original playing.

8. More recipes

FOR THE STRANGER SIDE OF MINIMUSMAXIMUS

Flowing Micro Cloud

PADS / VOCALS

Character	Deep
Focus	Full
Effort	62%
Motion	28%
Space	52%
Glue	38%
Width	135%
Micro Loop	58%

The loop holds musical fragments for several cycles while the airy grain cloud fills the gaps.

Broken Radio

SPOKEN WORD / LOOPS

Character	Dusty
Focus	Body
Effort	72%
Motion	22%
Space	12%
Glue	30%
Width	90%
Glitch	68%

More damaged and narrow. Keep Output matched because the lo-fi colour can feel louder than it is.

Strange Bloom

AMBIENT / DRONES

Character	Strange
Focus	Air
Effort	68%
Motion	48%
Space	70%
Glue	25%
Width	140%
Rev Grain	52%
Micro Loop	48%

A slower-moving, more atmospheric patch. Let notes ring so the grain layers have time to overlap.

Flip Companion

ANY SOURCE

Start	Your current sound
Press	FLIP
Listen	2-4 bars
Adjust	Effort only
Compare	Press FLIP again

Use FLIP as an A/B composition tool: the opposite state can reveal a second section, breakdown or counter-texture.

9. Finishing tips

HOW TO GET THE BEST FROM THE PLUGIN

1 Use one big idea at a time.

If Character + Effort already sound dramatic, add only one creative FX first.

2 Keep the middle of the sliders musical.

The 40-70% area is designed to be the broad sweet spot; the final part is more extreme.

3 Let Micro Loop breathe.

Sustained sources reveal the crossfades, harmonic-safe speed changes and airy grain cloud better than very short notes.

4 Use Glue after the creative FX.

A little Glue can make fragmented processing feel like part of the original source.

5 Check bypass at matched loudness.

Use Output to compare fairly. If the effect is only better because it is louder, trim it back.

6 Save the accidents.

If Random or FLIP produces something special, save the preset before moving on.

SLOWFIELD AUDIO

MinimusMaximus is designed to get to interesting sound quickly: choose an attitude, choose what matters, add effort, then decide whether to polish it or break it.
